The present thesis tries to figure out, if the Working Capital Management of German companies is reactive to changing interest rates for their refunding or if it is really a proactive improvement since the beginning of the 2000s as claimed by the literature. After a theoretical definition of Working Capital, its functions, goals and its relationship to the management process, Working Capital will be set into a context of company crises to lead to the central object of investigation, the Global Financial Crisis. With a quantitative analysis via DataStream of the companies currently listed in the DAX, MDAX and SDAX (N=130) it will be examined, if the credit crunch for companies in the Global Financial Crisis and the easy refunding possibilities afterwards due to the easy money policy of the European Central Bank had effects on the quality of the Working Capital Management. The analysis of the data via SPSS will show, that the possibilities of refunding indeed influence this quality, whereby the intensity of the reactionary behaviour of the companies depends mainly on the object of cognition, which is in this thesis examined by the parameters size, age and industry sectors, so that the results could serve as a basis for further management research.

Managing Global Finance Integration in Asia

Many questions have been raised about America's status in the increasingly interconnected global economy. Yet key facts--such as the amount of foreign assets abroad owned by U.S. citizens--are not known. The crucial data needed to assess the U.S. position are unavailable. This volume explores significant shortcomings in U.S. data on international capital transactions and their implications for policymakers. The volume offers clearcut recommendations for U.S. agencies to bring data collection and analyses of the global economy into the twenty-first century. The volume explores how factors emerging since the early 1980s have shaped world financial markets and revealed shortcomings in data collection and analysis. How the existing U.S. data system works and where it fails; how measurements of international financial transactions are recorded; and how swaps, options, and futures present special reporting problems. How alternative methods, such as collecting data from sources such as global custodians and international clearinghouses, might improve coverage and accuracy.
